Peer-to-peer

T-110.7100 Applications and Services in Internet, Fall 2009

Jukka K. Nurminen

Schedule

Tue 15.9.2009 12-14	Introduction to P2P (example P2P systems, history of P2P, what is P2P)	Content delivery (BitTorrent and CoolStreaming)
Tue 22.9.2009 12-14	Unstructured content search (Napster, Gnutella, Kazaa)	Structured content search (DHT)
Tue 29.9.2009 12-14	Energy-efficiency & Mobile P2)

Skype

How skype works: http://arxiv.org/ftp/cs/papers/0412/0412017.pdf

SETI@home (setiathome.berkeley.edu)

- Currently the largest distributed computing effort with over 3 million users
- SETI@home is a scientific experiment that uses Internet-connected computers in the Search for Extraterrestrial Intelligence (SETI). You can participate by running a free program that downloads and analyzes radio

telescope data.

Folding@home (http://folding.stanford.edu/)

PPLive, TVU, ...

"PPLive is a P2P television network software that famous all over the world. It has the largest number of users, the most extensive coverage in internet."

dist. beatlest. beat

-

46-61-5

Chantel 54

Shilv-Sports One

- 100 million downloads of its P2P streaming video client
- 24 million users per month
- access to 900 or so live TV channels
- 200 individual advertisers this year alone

Rise of P2P

CacheLogic Research | Internet Protocol Trends 1993 to 2006

• 1999: *Napster*, first widely used p2p-application

P2P represented ~65% of Internet traffic at end 2006, CacheLogic 2007

• P2P data currently represents 44.0% of all consumer traffic over the Internet and 33.6% in North America. Much of this data is audio and video files (over 70%).

• P2P Traffic to Grow Almost 400% over the Next 5 Years

• legitimate P2P traffic is expected to grow 10 times as fast as illicit P2P traffic Multimedia Intelligence, November 2008

Development of P2P Applications

Traffic portions of the different P2P applications and protocols from the traffic measured per week in the Abilene backbone from 18.02.2002 until 18.010.2004

Data source: http://netflow.internet2.edu/weekly/

Evolution of P2P via example applications

P2P Protocols:

- 1999: Napster
- 2000: Gnutella, eDonkey
- 2001: Kazaa
- 2002: eMule, BitTorrent
- 2003: Skype
- 2004: PPLive
- 2005: TVKoo, TVAnts, PPStream, SopCast...
- 2006: WoW distribution via P2P
- 2007: Joost, Vuze
- Next: Gaming, mobile P2P

Application type:

File Download Streaming Telephony Video-on-Demand Gaming

Driving Forces Behind Peer-to-Peer

Development of the terminal capabilities:

- 1992:
 - Average hard disk size: ~0.3Gbyte
 - Average processing power (clock frequency) of personal computers: $\sim 100 \text{MHz}$
- 2002-04:
 - Average processing power (clock frequency) of personal computers: ~ 3GHz
 - Average hard disk size: 100 Gbyte
 - \times \rightarrow Personal computers have capabilities comparable to servers in the 1990s
- 2007: Nokia N95 mobile phone
 - ARM9 ~1GHz clock frequency
 - Up to 2GB external Micro SD

Development of the communication networks:

- Early 1990s: private users start to connect to the Internet via 56kbps modem connections
- 1999
 - Introduction of DSL and ADSL connections
 - Data rates of up to 8.5Mbps via common telephone connections become available
 - The deregulation of the telephone market shows first effects with significantly reduced tariffs, due to increased competition on the last mile
 - \times \rightarrow bandwidth is plentiful and cheap!
- 2007 Nokia N95
 - HSDPA 1.8 Mbps

Definition of Peer-to-peer (or P2P)

- A peer-to-peer (or P2P) computer network is a network that relies primarily on the computing power and bandwidth of the participants in the network rather than concentrating it in a relatively small number of servers.
- A pure peer-to-peer network does not have the notion of clients or servers, but only equal peer nodes that simultaneously function as both "clients" and "servers" to the other nodes on the network.
- This model of network arrangement differs from the client-server model where communication is usually to and from a central server.

Taken from the wikipedia free encyclopedia - www.wikipedia.org

Why is P2P so successful?

- Scalable It's all about sharing resources
 - No need to provision servers or bandwidth
 - Each user brings its own resource
 - E.g. resistant to flash crowds
 - flash crowd = a crowd of users all arriving at the same time

capacity

Resources could be:

- •Files to share;
- •Upload bandwidth;
- •Disk storage;...

Why is P2P so successful? (cont'd)

- Cheap No infrastructure needed
- Everybody can bring its own content (at no cost)
 - Homemade content
 - Ethnic content
 - Illegal content
 - But also *legal* content
 - ...
- High availability Content accessible most of time

Client/Server: Poor scalability necks

2. Edge capacity

3. End-to-end bandwidth

(Streaming TV quality picture to 4000 users would require 3 Gbps outbound bandwidth)

Collaborative Communications

Client Clien Client Client Client Client

Through cooperation, data transfer from the server can be reduced. Releases some or all of the bottlenecks.

> "The server workload is reduced by 41% even when users share only videos while they are watching. When users share videos for one day, the server workload reduces by a tremendous 98.7%, compared to a clientserver approach."

Cha, M., Kwak, H., Rodriguez, P., Ahn, Y., and Moon, S. 2007. I tube, you tube, everybody tubes: analyzing the world's largest user generated content video system. In Proceedings of the 7th ACM SIGCOMM Conference on internet Measurement (San Diego, California, USA, October 24 - 26, 2007).

Some P2P research topics
